

The life cycle of a Sunflower

วงจรชีวิตของดอกทานตะวัน

The life cycle of a Sunflower

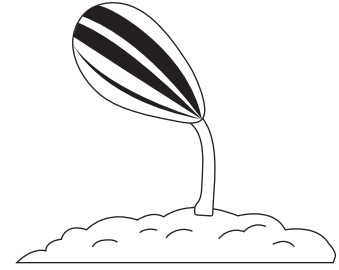

วงจรชีวิตของดอกทานตะวัน

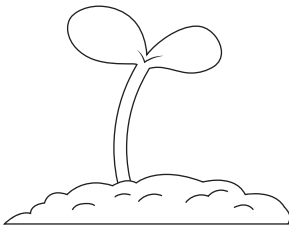

The small, dry part of a plant that grows into a new plant when given light and water.

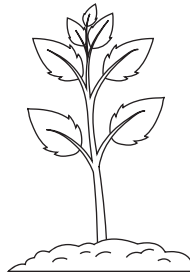

The first part of the root to come out of the seed. It grows down into the soil.

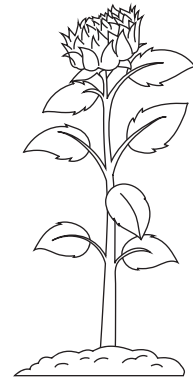

The first, small shoot of green that comes out of the ground, into the light. It still has the seed shell attached.

Leaves start to form on the plant and the seed shell has fallen off.

Many leaves have grown on the plant, and it has grown tall, strong, and sturdy.

A flower bud has formed on the plant. The plant roots are stretching down deep to find enough food and water for the flower to open and grow.

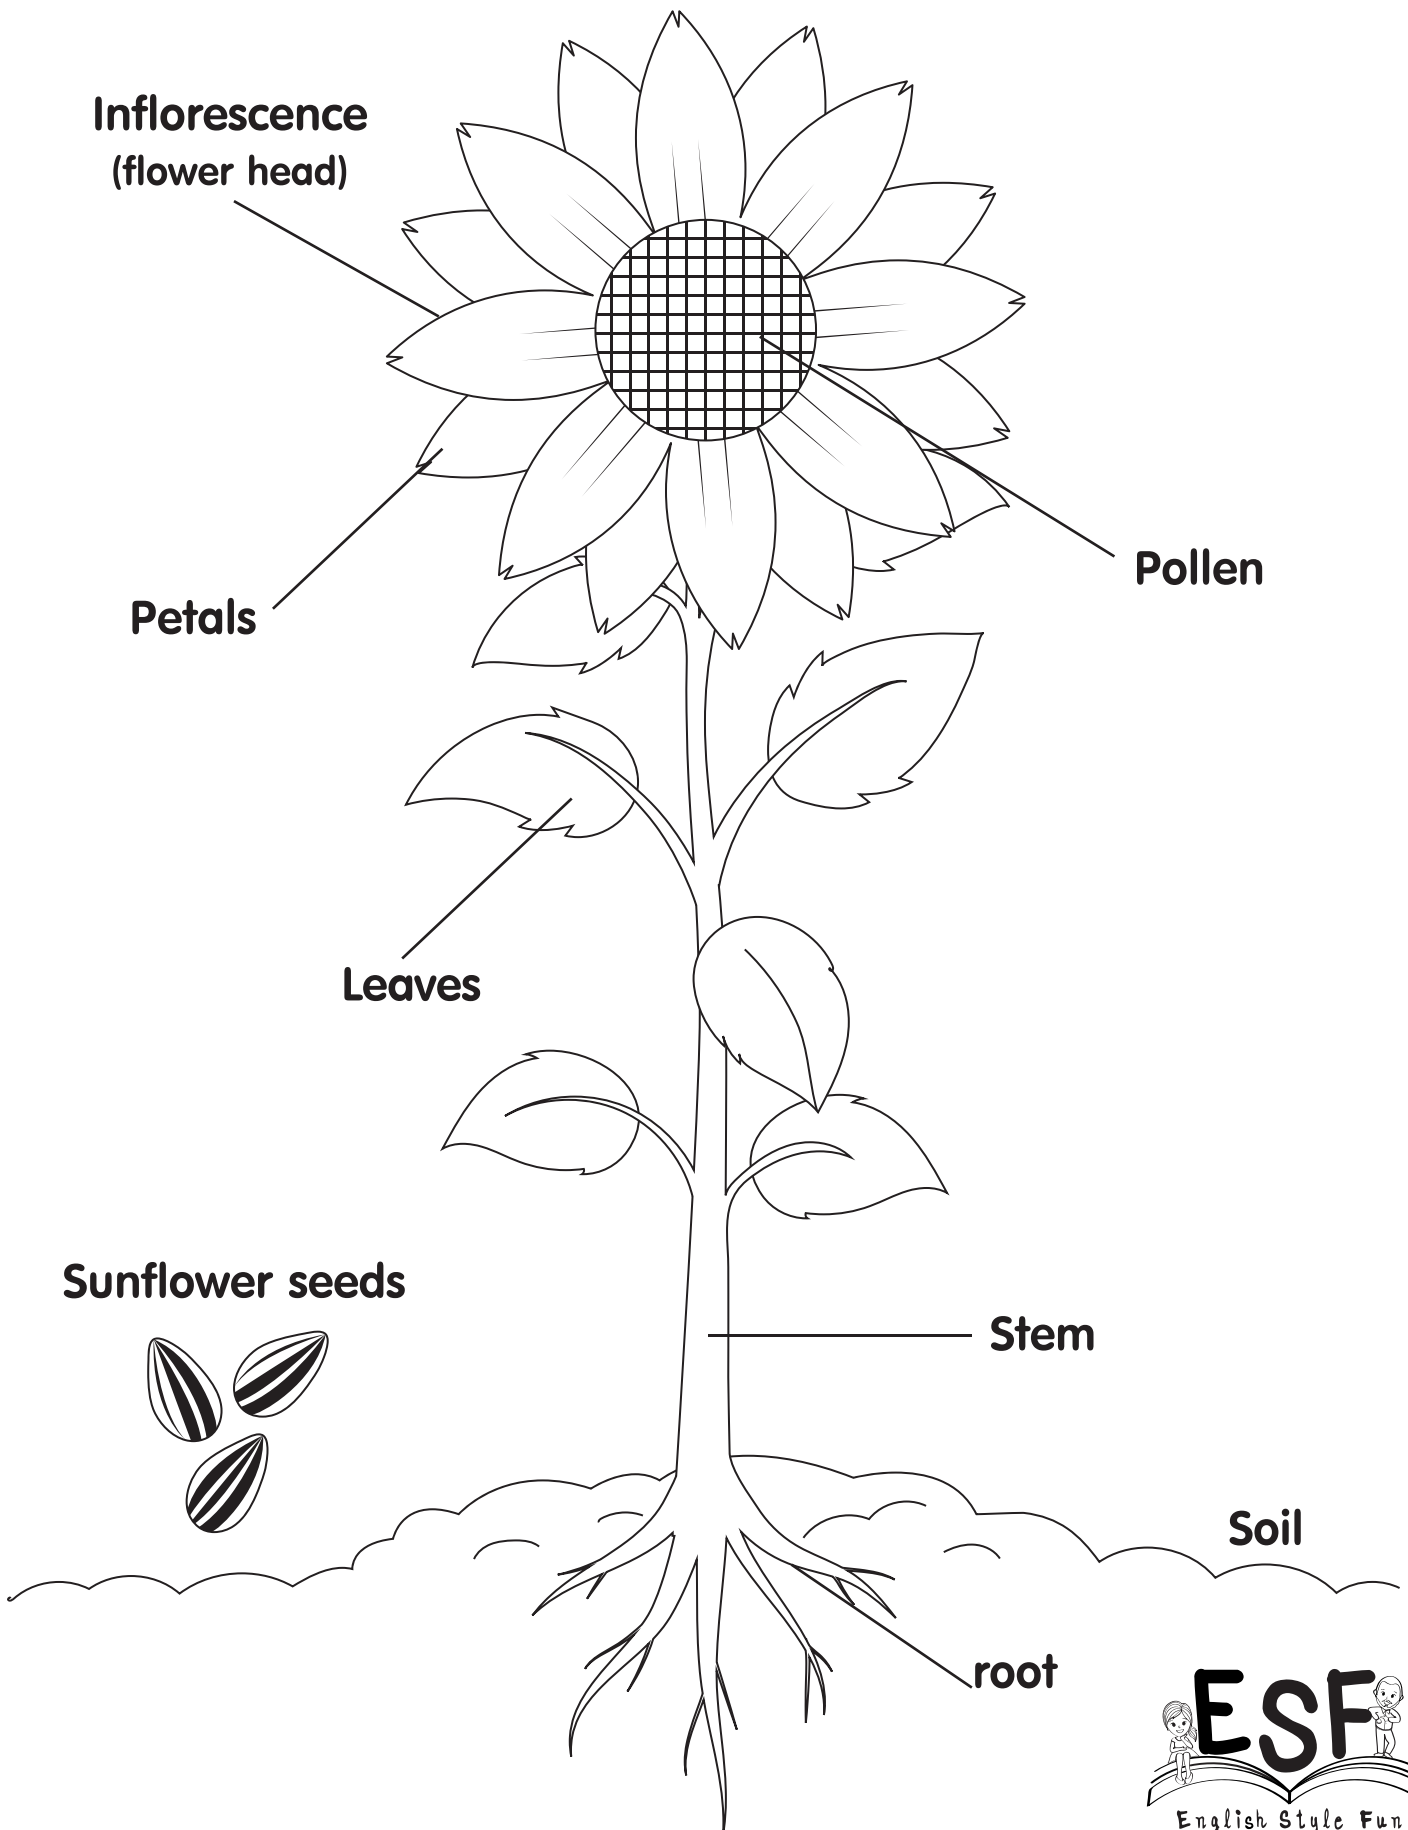

The plant has grown big and the flower is fully opened. The plant is no longer growing once it becomes fully grown.

The plant begins to wilt and dry out. Once the plant has dried out, the seeds will drop and the cycle will start all over again.
