The life cycle of a Watermelon

วงจรชีวิตของแตงโม

A watermelon takes about 3 months to grow. The process begins by planting a seed in the soil, which is another term for dirt.

The first part of the seed to emerge is the root, which grows downward into the soil.

The watermelon seed then germinates, meaning the seedling sprouts and becomes visible above the surface.

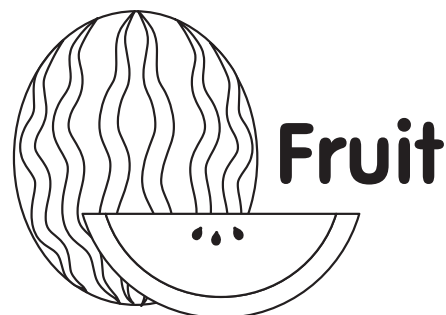

Next, the plant will begin to produce vines, which can extend as long as 12 feet.

As the vine develops, the watermelon plant will start to bloom. Each flower that appears will eventually become a watermelon.

The fruit begins forming from the flower, and it takes around one month for the watermelon to fully mature and be ready for harvest.
